

Is chiropractic scientific?

Chiropractors have always sought to provide the safest and most effective healing techniques for their patients. In order to achieve this, the chiropractic profession has been dedicated to conducting scientific studies to improve their diagnostic and adjusting techniques.

In the last 20 years the chiropractic profession has established an impressive array of scientific research that demonstrates the efficacy, safety and cost effectiveness of chiropractic care. In fact, the chiropractic profession has accumulated a greater number of scientific trials on chiropractic than the medical profession has accumulated for many of the treatments rendered by medical doctors. According to David M. Edy, M.D., Ph.D., professor of health policy and management with Duke University, North Carolina, only 15 percent of all medical interventions are supported by solid scientific evidence. “There are considerably more randomized controlled trials which show benefit of chiropractic than there are for many, many other things which physicians and neurosurgeons do all the time.”—Paul G. Shekelle, M.D., M.P.H., of the RAND Corporation, interviewed on ABC’s 20/20

So as you can see chiropractic is extensively supported by scientific research.
